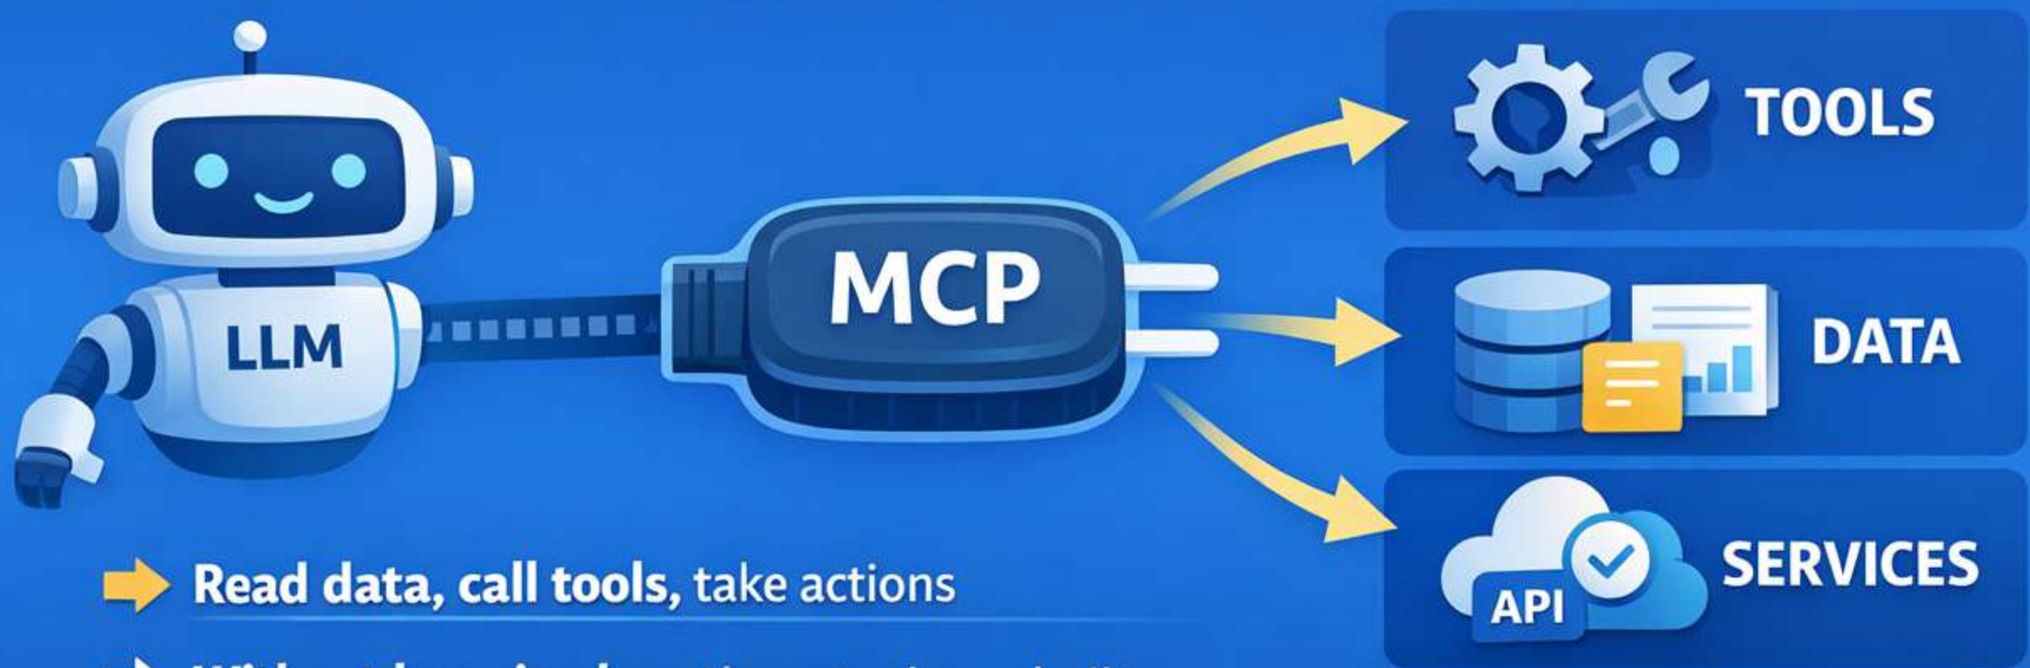
What is MCP?

Model Context Protocol (MCP)

MCP is a **standard** way for AI models to **connect** with **tools, data,** and services.



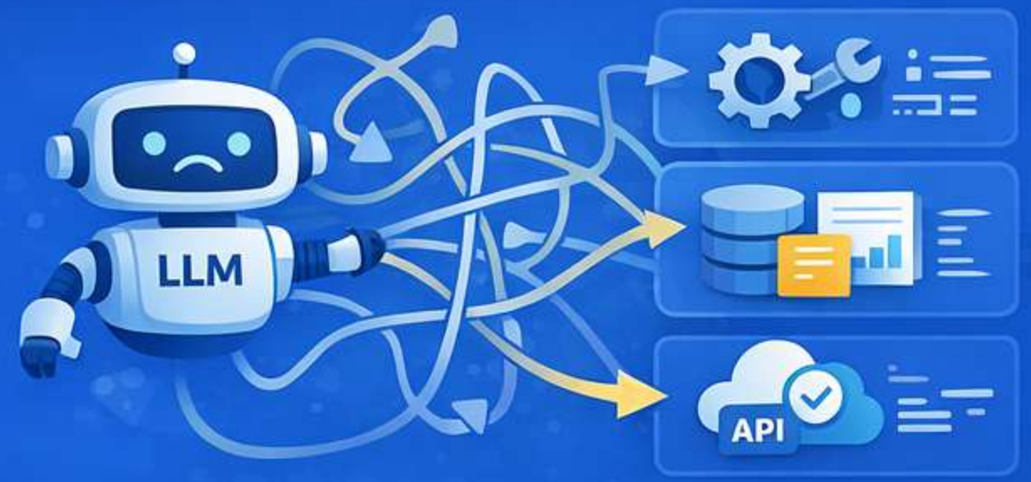
- **Read data, call tools,** take actions
- **Without *knowing how*** those tools are buiit

Think of **MCP** as a **universal connector for AI**

Why MCP Exists

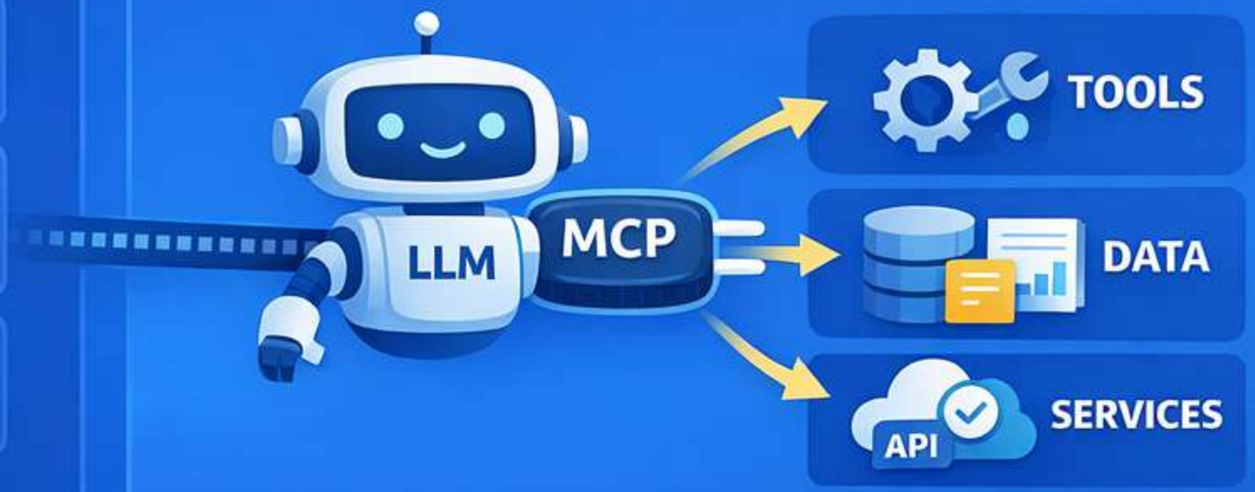
Before MCP

- **Custom integration** for every **tool**
- **Tight coupling** with **one model**
- **Hard** to scale & maintain



With MCP

- One **standard** interface
- **Reusable** tools
- **Model-agnostic** design



Same **tool** → works with **multiple AI models**

MCP Explained with an Example

Example

"Show last month's sales and **summarize trends**"

1. **LLM understand** the request
2. MCP expeses a **Sales Data Tool**
3. Hard to scale & maintain

3. **Tool** returns structured data
4. **LLM summarizes** insights

Model never talks to CRM directly

MCP Analogy

Office Analogy

LLM → Employee

MCP → Reception Desk

Tools/APIs → Departments

- You don't visit every department
- You tell **reception** what you need
- They fetch it for you

MCP = Reception Desk for AI

Advantages of Using **MCP**

- **Standard** tool access
- **Clean agent** design
- **Model-agnostic** architecture
- Faster development
- **Better security** & permissions
- **Scales for enterprise AI & agents**

MCP turns LLMs into real-world **AI agents**
